

Web3 & The Banking System's Blockchain Offensive

How the Biggest Banks Are Fighting Back

By Samuel Je Christian · Web3 Corner Date: June 6, 2026

The Threat Banks Couldn't Ignore

For years, banks watched blockchain from a distance.

Some dismissed it. Some experimented quietly. Most hoped it would go away.

It didn't.

\$300 billion in stablecoins now circulate on-chain. Western Union runs on Solana. DoorDash pays contractors via blockchain. The GENIUS Act passed — 20 banks queuing for licenses. A \$2 billion deal settled by a Trump-linked stablecoin.

The threat is no longer theoretical. Stablecoins are eating into bank deposits. And the world's biggest banks have decided:

If you can't beat them — build better.

The Breaking News — June 6, 2026

[!IMPORTANT] JPMorgan, Bank of America, and Citigroup announced plans this week to launch a **shared tokenized network** together.

Not a pilot. Not a paper. A production-grade, shared blockchain infrastructure for the three largest banks in America — designed specifically to tackle the threat of stablecoins eating into their deposits.

The timeline: **launch next year.**

Think about what this means: Three banks that normally compete fiercely — building shared infrastructure together — because the common threat (blockchain-native finance) is larger than their competition with each other.

What Is a Shared Tokenized Network?

A tokenized network allows banks to:

-  Issue digital versions of deposits on-chain
-  Settle transactions between institutions instantly
-  Move money 24/7 — not just banking hours
-  Reduce the cost of correspondent banking
-  Compete with stablecoin settlement speed

Instead of each bank building separately — JPMorgan, BofA, and Citi will share the same blockchain rails.

Common standards. Common settlement. Interoperable by design.

This is significant because fragmentation has been one of blockchain's biggest problems. When

major banks agree on shared standards — the entire ecosystem benefits.

Why Banks Are Threatened By Stablecoins

Traditional banks make money from deposits.

You put \$1,000 in a bank. The bank lends \$900 of it out. It earns interest on that loan. You earn a fraction — or nothing — on your \$1,000.

Stablecoins break this model.

If you hold \$1,000 in USDC — the bank doesn't have it. It can't lend it. It can't earn interest from it. It loses a customer — and the float.

[!WARNING] At **\$300 billion in stablecoins today** — and a projected **\$13 trillion in tokenized assets by 2030** — the scale of potential deposit migration terrifies bank CFOs globally.

The ECB's Christine Lagarde warned about this. European banks pushed back on the GENIUS Act. The shared tokenized network is JPMorgan's answer: **Build blockchain infrastructure that keeps deposits inside the banking system — while offering the same speed and programmability that stablecoins provide.**

JPMorgan's Head Start — Kinexys

JPMorgan didn't wait for this moment. They started building years ago.

Kinexys — JPMorgan's blockchain division — has been processing real transactions since its launch as Onyx.

In June 2026:

- 🏦 **KBank and Ant International** are building a blockchain USD rail using Kinexys by JPMorgan in Thailand — real settlement architecture.
- 📈 **Kinexys** processes billions in daily transactions.
- 🚀 **JPMorgan** presented at Paris Blockchain Week on tokenization reshaping financial infrastructure.

JPMorgan is not experimenting. It is operating — at scale.

The shared network with BofA and Citi is the next step: industry-wide adoption of the infrastructure JPMorgan built first.

Stellar — The Unexpected Winner This Week

Among the breaking news this week, one development stood out:

[!TIP] **DTCC chose Stellar's network for its tokenized securities platform rollout.** > Stellar XLM surged more than **40%** on the news.

Why Stellar?

- ⚡ Fast settlement finality
- 🟡 Low transaction costs
- 🏢 Designed for financial institution integration
- 🌐 Already used for cross-border payments
- 🛡 Built-in compliance tools for regulated assets

DTCC — which clears \$2.15 quadrillion annually — choosing a public blockchain for tokenized securities is a **watershed moment**. It validates the model that public blockchains — not just private bank chains — can serve as settlement infrastructure for traditional financial markets.

The Bitcoin Price Context

- **Bitcoin is at \$61,971 today.** Down 4.9% in 24 hours. Crypto is experiencing its worst week since July 2024.
- **Michael Saylor's response** to the selloff: *"This is temporary capital rotation into a \$400 billion AI buildout. Bitcoin's fundamentals haven't changed."*

The market is rotating: Capital flowing from **Bitcoin** → **AI stocks**. Bitcoin fear gauge surged nearly 20% — its biggest jump since the February crash.

Standard Chartered published what it calls three **"ifs"** that stand between Bitcoin and a market low:

1. **If** US-Iran tensions don't escalate.
2. **If** the Fed signals rate cuts in June.
3. **If** the CLARITY Act advances.

All three are unresolved. All three are June 2026 catalysts.

The Broader Picture — Banks and Blockchain

The progression is now clear:

2015-2020: Banks dismiss blockchain

└─ 2020-2022: Banks experiment privately

└─ 2022-2024: Banks pilot specific use cases

└─ 2024-2025: Banks launch production systems

└─ 2026: Banks announce shared industry

infrastructure

JPMorgan + BofA + Citi building together is the clearest signal yet that blockchain is not competing with banks. **It is becoming the infrastructure banks use.**

Franklin Templeton said it directly this week: *"Wall Street fears blockchain because it threatens its profits."* The banks' answer: build it themselves — before someone else builds it for them.

What This Means for Web3

The original Web3 narrative was banks vs. blockchain. Decentralized vs. centralized. The people vs. the institutions.

In 2026, that narrative has collapsed.

The institutions are building blockchain. The banks are building stablecoins. The regulators are writing the rules. And the public blockchains — Ethereum, Solana, Stellar — are becoming the settlement layer underneath all of it.

Web3 didn't replace banks. It gave banks better infrastructure. And some of them are smart enough to use it.

The One-Line Summary

JPMorgan, Bank of America, and Citigroup building a shared tokenized network together is the clearest signal yet that banks have stopped resisting blockchain infrastructure and started building it — because stablecoins and public blockchains have made the threat

impossible to ignore any longer.
